

New Roots SmartStack – ROOTED - RootStack

New Roots SmartStack Pitch

Your supplements. Your schedule. Smarter timing.

1. Executive Summary

New Roots Herbal has an opportunity to turn its extensive supplement portfolio into a personalized digital experience that helps consumers understand **not only what supplements to take, but when to take them — and why.**

New Roots SmartStack would be a mobile app that allows users to:

- Scan a New Roots product barcode
- Automatically identify the exact product and formulation
- Build their personal supplement "stack"
- Enter and schedule the number of capsules/doses they take
- Choose their normal meal, coffee, workout and bedtime schedule
- Automatically generate a personalized daily supplement schedule
- Receive reminders
- Identify potential timing conflicts between supplements
- Identify ingredients that may compete for absorption
- Flag relevant food/beverage interactions
- Flag relevant medication interactions
- Explain the reason behind each timing recommendation
- Adjust the schedule when the user's daily routine changes

Instead of simply saying:

"Take your iron at 8:00 AM."

the app could say:

Iron — 8:00 AM

Take with water.

Avoid taking at the same time as calcium.

Your schedule has moved your calcium supplement to 12:00 PM to help separate the two.

Coffee reminder: Your morning coffee is at 7:30 AM. We've scheduled your iron for 9:30 AM.

This transforms New Roots from simply being a supplement manufacturer into a company providing a **digital supplement-management ecosystem**.

2. The Problem with Regular Consumers

Consumers are increasingly taking multiple supplements at the same time.

The problem is that supplement routines become complicated very quickly.

Someone might take:

- A multivitamin
- Magnesium
- Calcium
- Iron
- Vitamin D
- Fish oil
- Probiotics
- Zinc
- An herbal formula
- A protein supplement
- Prescription medications

The consumer is then left to figure out:

- What should I take with food?
- What should I take without food?
- What should I take in the morning?

- What should I take at night?
- Can I take these together?
- Should I separate these?
- Can I take this with coffee?
- Can I take this with my medication?
- Do I need to take this every day?
- Which products already contain the same nutrients?
- Am I accidentally doubling up on something?

Even New Roots' own product directions can contain timing instructions. For example, the current Multi product says that people taking other medications should take the product a few hours before or after them.

Health Canada also specifically recommends that consumers tell healthcare professionals about the natural health products and medications they use to prevent interactions.

The information exists.

The problem is that consumers don't have an easy way to organize it.

3. The Solution

New Roots SmartStack

A personalized supplement scheduling engine.

The consumer enters their products once.

The system does the complicated work behind the scenes.

Step 1 — Scan

The consumer opens the app and scans:

"Add Supplement" → Scan Barcode

The system recognizes:

New Roots Herbal
Iron Bisglycinate
NPN XXXXXXXX

It automatically retrieves the product information.

Health Canada's Licensed Natural Health Products Database contains information including NPN, medicinal ingredients, dosage form, recommended use and risk information, creating an important Canadian regulatory data source for validating product information.

For New Roots products specifically, the company could maintain its own authoritative product database.

4. The Product Database

This is arguably the most valuable part of the entire project.

Every product would have a structured digital profile.

Product information

- Product name
- SKU
- UPC/barcode
- NPN
- Dosage form
- Serving size
- Recommended dose
- Medicinal ingredients
- Amount per dose
- Forms of nutrients
- Non-medicinal ingredients
- Allergens
- Warnings

- Contraindications
- Recommended use
- Storage requirements
- Current label
- Product status
- Version/revision date

Timing information

Each ingredient/product could also have structured attributes such as:

WITH FOOD

WITHOUT FOOD

WITH FAT

MORNING

EVENING

BEDTIME

SEPARATE FROM CALCIUM

SEPARATE FROM IRON

SEPARATE FROM SPECIFIC MEDICATIONS

SEPARATE FROM COFFEE/TEA

TAKE WITH WATER

REFRIGERATE

etc.

Importantly, these shouldn't be generated casually by AI.

They should come from a **reviewed rules database** supported by scientific literature, product labels, Health Canada information and review by appropriately qualified professionals.

5. The "Smart" Part

The app would have a **Supplement Scheduling Engine**.

Think of it as a rules engine rather than simply an AI chatbot.

For example:

User selects:

7:00 AM — Coffee

7:30 AM — Breakfast

12:00 PM — Lunch

6:00 PM — Dinner

10:00 PM — Bed

And enters:

- Iron
- Calcium
- Magnesium
- Multivitamin
- Fish oil
- Probiotic

The system evaluates the entire stack.

Instead of scheduling everything at 7:30 AM, it might create something like:

7:30 AM — Breakfast

Multivitamin

Take with breakfast.

9:30 AM

Iron

Scheduled separately from calcium-containing supplements.

Special note: Avoid taking with coffee/tea when applicable according to the validated interaction rule.

12:00 PM — Lunch

Fish Oil

Take with a meal.

6:00 PM — Dinner

Calcium

Take with food.

10:00 PM

Magnesium

Scheduled at bedtime based on the user's selected routine.

The exact rules would need to be determined and medically/regulatorily reviewed rather than assumed.

For example, NIH guidance specifically notes that calcium can interfere with iron absorption and that taking the two at different times may help avoid that problem.

6. The App Should Explain Its Recommendations

This is extremely important.

Instead of simply moving supplements around invisibly, the user should be able to tap:

"Why?"

And see:

Why are these separated?

Calcium may interfere with iron absorption. We've scheduled these at different times.

Then:

Learn more

- Evidence/source
- Product information
- Last reviewed
- Reviewed by

This creates transparency and consumer trust.

7. Interaction Severity System

Not every interaction is equally important.

The app should distinguish between:

Important

Potentially significant medication/supplement interaction.

Action required

Do not combine without speaking with your healthcare professional.

Timing conflict

Taking these together may interfere with absorption/effectiveness.

Action recommended

We've separated these by X hours.

Consideration

Timing may be preferable but isn't necessarily critical.

Taking this with food may be preferable.

Product instruction

Directly based on the product label.

New Roots recommends taking this product with food.

Informational

General educational information.

This prevents the app from making every interaction look like an emergency.

8. Personalized Schedule Creation

During onboarding, the app asks:

What time do you normally wake up?

7:00 AM

When do you drink coffee?

7:30 AM

Breakfast?

8:00 AM

Lunch?

12:00 PM

Dinner?

6:00 PM

Bedtime?

10:30 PM

Exercise?

5:30 PM

Then:

"Build My Schedule"

The engine creates the best-fit schedule within those constraints.

The user doesn't have to understand supplement timing themselves.

9. The Schedule Should Be Flexible

Real life isn't a fixed schedule.

The app should have:

"I'm running late"

Tap:

My morning changed

The app recalculates the day's schedule.

Or:

"I missed my 8 AM dose."

The app can provide the appropriate next-step information based on the product's validated rules.

This makes it much more useful than a standard reminder app.

10. Barcode + Label Scanning

There should be two ways to add a product.

Option A — Barcode

Scan UPC.

Option B — Label/photo

User photographs the Supplement Facts panel.

OCR identifies:

- Product
- Ingredients
- Dosage
- Strength

The user confirms the information before saving.

Existing supplement apps already demonstrate that barcode and label scanning are technically feasible.

The New Roots opportunity is to make the underlying product information and timing engine substantially more authoritative and brand-specific.

11. The Killer Feature: "Optimize My Stack"

The user presses:

OPTIMIZE MY STACK

The app analyzes:

Products

+

Ingredients

+

Dosages

+

Food

+

Coffee/tea

+

Medication

+

User schedule

And produces:

Your Personalized Schedule

7:30 AM

Breakfast supplements

9:30 AM

Iron

12:00 PM

Lunch supplements

6:00 PM

Dinner supplements

10:00 PM

Bedtime supplements

Then:

"3 adjustments were made"

1. Iron moved away from calcium.
2. Fish oil moved to a meal.
3. Magnesium moved to bedtime.

That is the feature I'd build the entire pitch around.

12. Duplicate Ingredient Detection

This is another major opportunity.

Suppose someone takes:

New Roots Multi

- **Cal-Mag**
- **Zinc**
- **Vitamin D**

The app could say:

"Your stack contains overlapping nutrients."

For example:

Vitamin D

- Multi: X
- Cal-Mag: X
- Separate Vitamin D: X
- Total: X

Then show:

"Your total daily intake from these products is X."

The app should not independently tell someone that a dose is unsafe unless the underlying rule and regulatory/clinical review support that conclusion.

Instead it could flag:

Review recommended

You're taking multiple products containing this nutrient. Consider discussing your total intake with a healthcare professional.

13. The Consumer Experience

The home screen could be extremely simple.

TODAY

 MORNING

7:30 AM

☐ Multivitamin

☐ Vitamin D

☐ Fish Oil

 9:30 AM

☐ Iron

 Take separately from calcium

 Avoid coffee/tea around this dose

 LUNCH

12:00 PM

☐ Probiotic

 EVENING

7:00 PM

☐ Calcium

 BEDTIME

10:00 PM

☐ Magnesium

14. "Why Am I Taking This?"

Each product could have:

What it is

Benefits

How to take it

Timing

Interactions

Warnings

Ingredients

Link to the website for more information

This turns the app into an educational tool rather than just a reminder.

15. New Roots' Competitive Advantage

This is where the business case becomes particularly interesting.

A generic supplement app has to figure out what products exist.

New Roots already has:

- The products
- The formulations
- The labels
- NPN information
- Product experts
- Scientific resources
- Regulatory resources
- Ingredient information
- Customer questions

- Consumer feedback
- A large existing product catalogue
- An established consumer brand

New Roots could create the **authoritative digital layer around its own products**.

The current New Roots website already contains extensive structured product information, including categories, ingredients, dosage directions and NPNs.

16. Phase 1 — Internal MVP

Phase 1

Build the New Roots product database.

Potentially start with the top 50–100 products.

For each product:

- SKU
- UPC
- NPN
- Ingredients
- Dose
- Directions
- Warnings
- Timing rules
- Known interaction rules
- Evidence sources
- Last reviewed
- Reviewer

Then build a simple web application.

MVP experience:

Scan product → Add to stack → Enter schedule → Generate schedule

That's enough to prove the concept.

17. Phase 2 — Employee Beta

Give it to:

- New Roots employees
- Customer service
- Sales reps
- Health professionals
- Select retailers

Collect feedback.

Questions:

- Did the schedule make sense?
 - Were instructions understandable?
 - Were there too many warnings?
 - Were the reminders useful?
 - Did people actually follow the schedule?
 - Which products create the most complicated routines?
-

18. Phase 3 — Consumer Beta

Release to a limited group of New Roots consumers.

Potentially make it:

Free with New Roots products.

That creates an ecosystem:

Buy New Roots → Scan → Build your stack → Get personalized schedule.

19. Phase 4 — Full Consumer App

Eventually expand beyond New Roots products.

The user could add:

New Roots

-

Other supplement brands

-

Medications

And SmartStack becomes a broader supplement-management platform.

New Roots would still have a significant advantage because its own products would have the deepest integration.

20. Business Model

\$4.99–\$9.99/month

Customer retention

The more products someone has inside their SmartStack, the more embedded New Roots becomes in their routine.

Cross-selling

Example:

"You already take X. Here's another New Roots product that could fit your routine."

Any recommendations would need to be carefully separated from the safety engine and comply with applicable advertising rules.

Health Canada regulates advertising of natural health products in Canada, so promotional recommendations would need regulatory review.

Product discovery

Someone buys one product.

The app helps them discover other products that fit their needs.

Education

Customers better understand how to use the products.

Customer service reduction

Instead of contacting New Roots asking:

"Can I take these together?"

the customer could receive validated product information directly.
